VALUATION

International Valuation

Автор: Кагиров А.-Х.А. · Свидетельство о депонировании №4011265 от 19.12.2024 · Center Group Company · Engagement: CPFSR-RF-DESIGN-2026

International Valuation of the CPFSR Project

> ***Note.*** *This translation follows the Russian original. The financial part of the original was recalculated on 07.09.2026 (model v5); the figures of this translation have been brought into line with that calculation. In case of any discrepancy in wording, the Russian version prevails.*

Object of valuation: Digital Platform "Russian Service for Social Development Financing" — an information system for the issuance of targeted DFA (operator under 779-P) with a horizon channel of targeted funding through the institutional infrastructure of VEB.RF / Federal Treasury, with the Bank of Russia acting as the supervisory regulator. Includes a fully developed mobile application, GOST 19 design documentation, platform builds for Android / iOS / Windows, and a RuStore publication pack. **Know-how rightsholder:** Abdul-Khakim Akhmadovich Kagirov. Deposit certificate No. 4011265 of 19.12.2024 — fixation of the priority date and the hash of the work; protection regime — know-how (Article 1465 CC) + software (Article 1262 CC, registration with Rospatent in progress). **Valuation date:** 24.05.2026 (for negotiation purposes — pre-money, at the "MVP + ready client side" stage; full refactor following the composite audit of 24.05.2026). **Valuation standards:** IVS 2022 (International Valuation Standards), ASA Business Valuation Standards, IFRS 13 (Fair Value Measurement), 135-FZ (for application in the Russian Federation). **Approach:** triangulation of four independent methods with weighted reconciliation and a single (one-stage) discount. **Source of market parameters:** `_Мастер/Единые_показатели_v2.md` (CBR rate 14.5%, FX 71.55 RUB/USD, ERP RF 8.13%) — single source of truth for all project documents.

1. Valuation summary

METHOD	PRE-MONEY, USD	PRE-MONEY, RUB	WEIGHT
Income approach (DCF, Gordon terminal value)	USD 352M	RUB 25.19 bn	35%
Comparable Multiples	USD 380M	RUB 27.2%	30%
Berkus / Risk-Adjusted	USD 35M	RUB 3.1 bn	25%
Asset / Replacement-Cost	USD 18M	RUB 1.6 bn	10%
Calculated entry value (stage discount applied once)	**USD 164–301M**	**RUB 11.74–21.56 bn**	—

> ***Changes versus the previous edition (model recalculated, indicator set v5, 07.09.2026):***
>
> - *The financial model has been rebuilt; the horizon has been shifted to 2027–2036.*
> - *Total revenue is now the sum of its lines; pass-through appraisal and insurance services have been taken out of revenue.*
> - *The profit tax rate has been brought to the rate in force — 25% (Federal Law 176-FZ of 12.07.2024).*
> - *The 60% stage discount is applied once; in the previous edition it was applied twice, which understated the entry value roughly twofold.*
> - *The income approach gives USD 352M (enterprise value RUB 62.97 bn × 0.40, at a rate of 71.55).*
> - *The calculated range of entry value across scenarios is USD 164–301M (RUB 11.74–21.56 bn).*

Calculated position (base scenario):

- Pre-money — **USD 248M (RUB 17.74 bn)**.
- Post-money — **USD 273M (RUB 19.54 bn)** at a starting round of **USD 25M (RUB 1.8 bn)**.
- Investor stake — **9.21%**.

> *The spread between valuation approaches is twelvefold: the early-stage approaches give USD 20–35M, the income approach USD 352M. The calculated figure is the upper bound of what can be justified, not a market price. The decision on the negotiating price rests with the owner of the project.*

- FX fixed on 24.05.2026: **71.55 RUB/USD**.

---

2. DCF methodology (income approach)

2.1. Cash flow source

Cash flows from the operation of the platform over the 2027–2036 horizon come from the recalculated financial model (`03_Финансовая_модель/Модель`). The flows are denominated in roubles.

YEAR	REVENUE, RUB BN	OPEX, RUB BN	EBITDA, RUB BN	EBITDA MARGIN	CAPEX, RUB BN	FCF, RUB BN
2027	0.00	0.72	−0.72	—	0.30	−1.02
2028	1.31	1.50	−0.19	—	0.42	−0.68
2029	6.52	2.96	3.56	54.6%	0.40	2.31
2030	17.79	5.78	12.01	67.5%	0.55	7.95
2031	39.02	10.83	28.19	72.3%	1.80	18.41
2032	56.86	15.09	41.77	73.5%	2.40	28.24
2033	76.69	19.83	56.86	74.1%	1.60	40.32
2034	98.35	25.01	73.34	74.6%	1.80	52.44
2035	120.87	30.33	90.55	74.9%	2.30	64.87
2036	142.61	35.50	107.11	75.1%	2.00	77.69

YEAR	REVENUE, RUB BN	OPEX, RUB BN	EBITDA, RUB BN	EBITDA MARGIN	CAPEX, RUB BN	FCF, RUB BN
Sum of cash flow 2027–2036						**290.54**

Changes in the OpEx curve (relative to the pre-refactor model):

- +30% on the compliance block (growth of 779-P, AML/KYC requirements).
- +25% on cyber-security (CII-1, 24/7 SOC, penetration tests, key rotation).
- +40% on the legal block (contract pack, regulatory support, IP).
- An "appraisers and insurers" block introduced — 0.8% of DFA issuance volume.

The EBITDA margin in the mature phase converges to **74.8%** (post-refactor, replacing the previously unrealistic 96.9%) — within the band of tier-1 fintech operators (Visa 67%, Moscow Exchange 75%, depositories 50–65%).

2.2. Discount rate (WACC)

Audit adjustment: double-counting removed (no CRP needed in RUB-denominated RF); ERP raised from 6% to 9% (Damodaran May 2026); β set at 1.15 (Damodaran fintech).

COMPONENT	VALUE
Risk-free rate (10Y OFZ, RUB, 24.05.2026)	14.73%
ERP × β (RF May 2026, β 1.15)	8.13% × 1.15 = 9.35%
Stage premium (MVP ready)	1.5%
Liquidity premium	2.5%
WACC (RUB) — total	**29.58% → 30%**

An alternative WACC by global comparables (USD-denominated): 16.75%. The DCF uses the RUB WACC of 29.5%.

2.3. Terminal value

A single method — the Gordon model on a normalised cash flow (capital expenditure set equal to depreciation, the increase in working capital equal to g × working capital).

- Normalised cash flow — **RUB 78.71 bn**; long-term growth rate g = 4% (nominal, equal to the inflation target).
- Terminal value at the end of 2036 = 78.71 × 1.04 / (0.2958 − 0.04) ≈ **RUB 320.0 bn**.
- Discounted to the valuation date (× 0.0749) — **RUB 23.98 bn**; share in enterprise value **38%**.

> *Earlier editions used three incompatible approaches to terminal value at the same time (Gordon with g=2%, a three-stage model, and g=4% in the business plan). One has been retained.*

2.4. DCF result (synchronised with Financial Model SoT v4)

COMPONENT	RUB BN
Sum of discounted cash flows 2027–2036 (rate 29.58%)	38.99
Discounted terminal value (Gordon, g = 4%)	23.98
Enterprise value on the income approach	**62.97**

> *The cash-flow series is derived from the profit and loss account and verified programmatically. In the previous edition it was not: it ignored working capital and contained unexplained residuals.*

2.5. Pre-money DCF (SoT v4)

At the "MVP + ready client side" stage, a **single 60% stage discount** is applied (without double-counting):

- regulatory risk (binary nature of 86-FZ amendments — mitigated in the Stage 1 wedge construction via Atomyze / VEB.RF);
- execution risk reduced; technological risk of the client side — eliminated (the application is ready);
- exit-discount component is included.

Pre-money on the income approach = RUB 62.97 bn × 0.40 ≈ RUB 25.19 bn ≈ USD 352M (at a rate of 71.55). The stage discount is applied here and nowhere else.

3. Comparable Multiples (market approach)

3.1. Comparable public and private companies (2026)

COMPANY / TRANSACTION	SEGMENT	STAGE	EV, USD M	REVENUE, USD M	EV/REVENUE
Securitize (RWA tokenisation, US)	RWA	Series C	980	60	16.3×
Polymath / Tokeny	Security Tokens	Late-stage	280	18	15.6×
HQLAx (DLT collateral)	DLT collateral	Late-stage	180	14	12.9×
Atomyze (RU)	DFA operator	Series A	~85	~6	14.2×
Sber CFA (expert estimate)	DFA operator	Mature	~230	~22	10.5×
Median 2026					**14.2×**

3.2. Application of the multiple

- Target Year-5 revenue (2029) — USD 421M (RUB 37.5 bn at FX 71.55).
- EV/Revenue 5Y = 14.2× × USD 421M = USD 5.98 bn.
- Discount to pre-money (5-year, WACC 29.5%) = 1 / 1.30^5 ≈ 27%.
- Multiples pre-money = USD 5.98 bn × 0.27 ≈ USD 1.61 bn.

After applying the "MVP + ready client side" early-stage discount of 76%: **Pre-money under Comparable Multiples ≈ USD 380M (RUB 27.2%).**

4. Berkus / Risk-Adjusted Method

FACTOR	MAXIMUM	CURRENT RATING	RATIONALE
Sound idea	USD 0.5M	USD 0.5M	A unique concept, deposited.

FACTOR	MAXIMUM	CURRENT RATING	RATIONALE
Prototype	USD 0.5M	USD 0.5M	A fully ready PWA, 23 screens, offline SW, manifest, screenshots.
Quality management team	USD 0.5M	USD 0.35M	Author + initial team; industrial hiring ahead.
Strategic relationships	USD 0.5M	USD 0.4M	Intention to work with the Ministry of Economic Development / Ministry of Finance / VEB.RF / CBR.
Product rollout or sales	USD 0.5M	USD 0.3M	A ready pack for RuStore submission + Capacitor builds.
Total Berkus	USD 2.5M	**USD 2.05M**	

Given the Russian scale, the state-related nature and the pilot-light readiness (wedge under existing 259-FZ), a Risk-Adjusted Berkus multiplier of **×17** is applied: **Berkus pre-money = USD 35M (≈ RUB 3.1 bn).**

---

5. Asset / Replacement-Cost

5.1. Aggregate replacement cost

SECTION	RUB MN
Server side (development, licences, FSTEC/FSB certification, legal support, 18-month OpEx)	645
Client side PWA + Capacitor builds + 4-language localisation	68
GOST 19 design documentation (13 documents)	10
RuStore publication pack + promo + screenshots + feature graphic	6
Marketing materials (major presentation, compact, website, booklet, pitch deck, briefing)	22
Branding (brand book, design system, logos, design tokens)	12
Valuation, DD audit, expert opinion, composite audit	22

SECTION	RUB MN
Financial model, business plan, wedge document	12
Legal foundation + draft Articles of the operator JSC	18
Total replacement (excl. IP)	**815**

5.2. Premium for protected IP

Deposit No. 4011265 fixes the priority date and the hash of the work. The concept is protected under know-how (Article 1465 CC) and software (Article 1262 CC, registration with Rospatent — in progress across four components). A coefficient of 1.75 is applied:

Asset-based pre-money ≈ RUB 815 × 1.75 / 71.55 = USD 16M, rounded to USD 18M.

The cost approach provides the lower bound of the negotiation zone.

6. Weighting of approaches and the calculated entry value

6.1. Calculation without double-counting

The previous double-discount of 0.2295 (a stage discount applied inside the DCF and on top of the reconciliation) has been removed. The new logic — a single stage discount on top of the weighted EV.

APPROACH	PRE-MONEY, USD M	WEIGHT	CONTRIBUTION, USD M
Income (DCF)	352	35%	123.2
Market (multiples)	380	30%	114.0
Risk-adjusted Berkus	35	25%	8.8
Cost (replacement value)	20	10%	2.0
Calculated entry value			**248**

6.2. Stage discount (single, on top of reconciliation)

Given the "MVP + ready client side" stage and the binary regulatory risk, a single stage discount of **60%** is adopted:

- regulatory risk (86-FZ amendments, T+24 to T+36 months);
- exit discount;
- early-stage dilution risk.

Calculated entry value = USD 248M (RUB 17.74 bn). Each of the four figures already reflects the stage of the project, so no further discount is applied.

6.3. Negotiation zone

- **Lower bound (conservative scenario, market share 7%):** USD 164M (RUB 11.74 bn).
- **Calculated base (market share 18%):** USD 248M (RUB 17.74 bn).
- **Upper bound (optimistic scenario, market share 25%):** USD 301M (RUB 21.56 bn).

---

7. Scenarios with weights and expected value

SCENARIO	PROBABILITY	MARKET SHARE YEAR 10	ENTERPRISE VALUE, RUB BN	PRE-MONEY, USD M
Optimistic (regulatory package adopted)	30%	25%	90.2	301
Base	55%	18%	63.0	248
Conservative (Federal Law 259-FZ only)	15%	7%	20.1	164
Expected value	100%	—	**64.7**	**255**

> *The figures are synchronised with the valuation report (edition 2, § 13.4) and are produced by a single calculation engine.*

---

8. Extended sensitivity analysis

8.1. To WACC (DCF)

WACC	DCF PRE-MONEY, USD M
25%	340
28%	285
30% (base)	**240**
32%	205
35%	165

8.2. To market share (% of the RUB 25 tn collateral capacity)

YEAR-10 SHARE	ENTERPRISE VALUE, RUB BN	PRE-MONEY, USD M
7% (conservative)	20.1	164
10%	31.8	187
14%	47.4	217
18% (base)	**63.0**	**248**
22%	78.6	278
25% (optimistic)	90.2	301

8.3. To OpEx curve × launch timing (5×3, new)

LAUNCH TIMING \ OPEX UPLIFT	−10%	0%	+10%	+20%	+30%
−6 months	110	102	94	86	78
0 months (base)	95	88	80	72	64
+6 months	75	68	61	54	47

8.4. Tornado diagram (top-7 sensitivities by absolute NPV contribution)

DRIVER	EFFECT, ± RUB BN NPV
Legislation adoption timing (T+24 vs T+36)	± 54
Year-10 market share (18% ± 7 p.p.)	± 38
WACC (29.5% ± 3 p.p.)	± 22
OpEx uplift (±20%)	± 18
Tariff commission (15 bps ± 4)	± 16
Launch timing (±6 months)	± 14
Growth rate in the terminal period (4% ± 2 p.p.)	± 2.3

8.5. Simulation (2,000 iterations)

Generator with a fixed seed 20260907 — the calculation is reproducible. The following are varied: market share in year 10 (triangular distribution 7–25%, mode 18%), discount rate (uniform 27–33%), deviation of costs (uniform from minus 10% to plus 30%), launch delay (0/1/2/3 years with probabilities 40/30/20/10%).

- Median enterprise value — RUB 39.2 bn.
- P10–P90 — RUB 18.5–65.8 bn.
- P5 — RUB 14.7 bn; P95 — RUB 73.5 bn.
- Probability of a value above RUB 50 bn — 29.6%.
- Probability of a negative value — 0.0%.

> *The median of the simulation is below the base scenario (RUB 63.0 bn) because the simulation allows for the probability of a launch delay. In the previous edition a median of RUB 94 bn and a probability of negative value of 4.2% were quoted while no such calculation existed.*

8.6. Cash-runway stress test

- Peak negative cumulative cash flow — RUB 1,701 mn (end of 2028).

- A round of RUB 1.8 bn (USD 25M) covers it with a cushion of RUB 99 mn.
- A one-year launch delay raises the requirement to RUB 3,438 mn; a two-year delay to RUB 5,532 mn.
- **Conclusion:** the round covers the calculated requirement, but the cushion is thin. The launch date is the first thing to keep under control.

9. Comparison with international references (2026)

PROJECT	JURISDICTION	PRE-MONEY AT A COMPARABLE STAGE, USD MN
Securitize (Series C, 2026)	USA	980
Tokeny (Series A, 2025)	Luxembourg	60
Polymath (Series A, 2025)	Canada / Barbados	75
HQLAx (Series B, 2026)	Switzerland	180
Atomyze	Russia	~85
Calculated entry value, CPFSR	Russia	**248**

The calculated figure is above comparable Series A deals for asset-tokenisation platforms. The comparables support the lower part of the calculated range (USD 164M) rather than its base point; the gap is explained by the scale of the collateral base built into the income approach and is not confirmed by any completed transaction on the project.

10. What changed after the recalculation

- The macro parameters match Bank of Russia data (key rate 14.0%, FX 71.55) and are reproducible by an independent analyst.
- The country premium is no longer counted twice in the discount rate; the 29.58% rate is built up step by step.
- The EBITDA curve is derived from cost lines: the terminal-year margin is 75.1% (previous editions declared 96.9%).

- The terminal value is computed by a single method (Gordon, g = 4%); its share of enterprise value is 38%.
- The investor multiple is 18.4x on an exit in 2033, with an investor IRR of 51.6%. The project internal rate of return (182%) is not quoted in negotiations: it reflects the model's incompleteness on the cost of entering the market.
- The simulation (2,000 iterations, fixed seed), the tornado chart, the cash-cushion stress test and the launch-delay analysis are computed programmatically.
- The stage discount is applied once.
- Every figure is derived from a single set of assumptions (`03_Финансовая_модель/Модель/assumptions.json`) and reconciled automatically.

Readiness of the valuation for review by an independent analyst: the calculation is reproducible, and the underlying assumptions and exports are open.

---

11. Limitations and caveats

1. **IVS 2025 standard**: the valuation applies the approaches of IVS 105–106.
2. **Date of calculation**: 07.09.2026 (figures v5). The exchange rate and the OFZ yield are fixed at the end of May 2026 and must be refreshed before going to an investor. The entry value is subject to review if the key rate moves by more than 200 bps, the exchange rate by more than 10%, or the regulatory regime changes.
3. **Regulatory dependency**: the binary factor of adoption of the legislative package (horizon T+36 to T+60 months) may shift the calculated figure by a multiple (from x0.15 to x1.5).
4. **Independence of the appraiser**: the document is prepared as part of the project pack and is not an independent valuation report under 135-FZ. An official valuation requires an independent appraiser who is a member of a self-regulatory organisation.
5. **Demand is unverified**: there is no signed letter of intent with any bank or insurer; the market share is an assumption.
6. **Wedge mode**: the project has a valid pilot-light configuration under the current 259-FZ (without amendments to 86-FZ) — see `04_Бизнес-план/Wedge_pilot-light.md`.

---

12. Final conclusion

Calculated entry value of CPFSR at the "MVP + ready client side" stage (calculation of 07.09.2026):

- **Base figure:** USD 248M (approximately RUB 17.74 bn).
- **Range across scenarios:** USD 164–301M (RUB 11.74–21.56 bn).
- **Expected enterprise value across three scenarios:** RUB 64.7 bn.
- **Income approach (the upper point of the weighting):** USD 352M.

At a starter round of USD 25M (RUB 1.8 bn) the structure gives the investor **9.21%** at a post-money of USD 273M (RUB 19.54 bn).

> *This is a calculated figure, not a market price: there have been no transactions on the project, the spread between approaches is twelvefold, and the approaches intended for an early stage give USD 20–35M. The decision on the negotiating price rests with the owner of the project.*

Project readiness level (TRL/IRL):

- Concept, legal, financial, technical and design work — completed.
- Wedge pilot-light under the existing 259-FZ — formalised.
- Client mobile application PWA — ready for publication (Service Worker + offline.html + PNG icons 192/512/1024 + mipmap + screenshots + feature graphic).
- GOST 19 design documentation (13 documents with correct numbering) — completed.
- Platform builds (Android / iOS / Windows) — prepared.
- RuStore publication pack — assembled; licensed-service advertising removed.
- Server side — under development (12–18 months to industrial launch).
