

Financial Model

Автор: Кагиров А.-Х.А. · Свидетельство о депонировании №4011265 от 19.12.2024 ·
Center Group Company · Engagement: CPFSR-RF-DESIGN-2026

Financial model of the CP RSFSR platform

Note. This is a translation of the Russian original. The financial part is generated from the same calculation engine, so the figures coincide with the Russian version. In case of any discrepancy in wording, the Russian version prevails.

Author and rights holder: Kagirov A.-Kh.A. Deposit certificate No. 4011265 of 19.12.2024 — fixing the priority date and the hash of the work; protection regime — know-how (Art. 1465 Civil Code) plus computer programme (Art. 1262 Civil Code; registration with Rospatent in progress).

Edition: v5 of 07.09.2026. **Horizon:** 10 years (2027–2036) plus terminal value. **Valuation date:** 31.12.2026. **Currency:** roubles; unless stated otherwise, RUB mn.

Every figure in this document is computed programmatically from a single set of assumptions in `Модель/assumptions.json`. The document is assembled by `Модель/собрать_документ_i18n.py`; figures must not be edited in the text — they are overwritten at the next build. Machine-readable export: `Модель/Выгрузка/*.csv`.

Convergence self-check passed: total revenue equals the sum of its lines, operating expenses equal payroll plus other costs, EBITDA equals revenue less operating expenses, free cash flow equals EBITDA less profit tax, less the increase in working capital and less capital expenditure, and enterprise value equals discounted cash flows plus discounted terminal value.

What changed in edition v5

Edition v5 is a recalculation, not a cosmetic edit. Below is what was corrected in substance.

WHAT IT WAS	WHAT IT BECAME AND WHY
Total revenue did not equal the sum of its lines (in 2034 the lines added up to RUB 175,492 mn against a stated total of RUB 137,905 mn)	The total is computed as the sum of the lines. A discrepancy is impossible by construction
Appraisal and insurance services (0.8% of volume) were booked as platform revenue in full, although the notes to the model marked them as pass-through with 85% offsetting costs	Recognised net: only the platform's own margin (0.12% of volume) enters revenue. Gross billings are disclosed on a separate memorandum line
Profit tax rate of 20%	25% — effective from 1 January 2025 (Federal Law 176-FZ of 12.07.2024). The previous rate was no longer in force
Losses of the early years were not carried forward	Loss carry-forward is applied, capped at 50% of the tax base
Payroll was not derived from headcount and salary (the 2029 line implied roughly twice the stated headcount, the 2026 line roughly half of it)	Payroll = headcount × salary × 12 × 1.30. Other costs = an indexed base plus a variable share of revenue

WHAT IT WAS	WHAT IT BECAME AND WHY
The horizon began in 2025; the first CFA issue was planned for 2026	Horizon 2027–2036. At the date of recalculation there is no information - system operator licence, no regulatory framework and no issues — so the first issue is placed in 2028
Terminal value was computed sometimes by Gordon with $g=2\%$, sometimes by a three-stage method; the business plan stated $g=4\%$	A single method: Gordon on a normalised cash flow (capital expenditure set equal to depreciation), $g = 4\%$
The cash-flow series in the valuation report was not derived from the profit and loss account (it ignored working capital and contained unexplained residuals)	The series is derived from the accounts and verified programmatically
The 60% stage discount was applied twice: inside the income approach and then again on top of the reconciliation of methods	Applied once, and only to approaches that produce the value of a mature business
A payback of 2.8 years while cumulative cash flow crossed zero in the fourth year	Computed programmatically: 2.73 years simple, 3.05 years discounted

Sheet 1. Assumptions

1.1. Macroeconomic parameters

PARAMETER	VALUE	SOURCE AND DATE
Bank of Russia key rate	14.00%	Board of Directors decision of 07.09.2026
10-year OFZ yield	14.73%	market data as at 21.05.2026
Equity risk premium	8.13%	Damodaran
Beta (financial services)	1.15	Damodaran
Stage premium	2.50%	IPEV Guidelines
Illiquidity premium	3.00%	IPEV Guidelines
Discount rate (WACC)	29.58%	sum of components
Inflation target	4%	Bank of Russia benchmark
USD/RUB rate	71.55	official rate as at 26.05.2026

The key rate was updated as at 07.09.2026. The 10-year OFZ yield and the exchange rate are fixed as at May 2026 and should be refreshed at the date of negotiations before approaching an external investor. The key rate does not affect the discount rate: the latter is built on the OFZ yield, while the key rate serves only as a cross-check.

1.2. Market

Collateral capacity of the market as at 2025 — **RUB 25,000 bn**: 10% of assets drawn into circulation, valued for collateral purposes at 50% of market value, out of the combined stock of housing, commercial real estate and land plots (RUB 507 tn). Indexation — 4% per year.

The circulating stack is the sum of issues over the last 5 years (the average life of an issue).

PARAMETER	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
Collateral capacity, RUB bn	27,040	28,122	29,246	30,416	31,633	32,898	34,214	35,583	37,006	38,486
Platform share, %	0.00	0.40	1.80	4.40	8.80	10.80	12.60	14.40	16.20	18.00
CFA issuance, RUB mn	0	112,486	526,436	1,338,318	2,783,702	3,553,016	4,310,993	5,123,923	5,994,989	6,927,543
Circulating stack, RUB mn	0	112,486	638,923	1,977,241	4,760,943	8,313,959	12,512,465	17,109,951	21,766,622	25,910,463

The market-share trajectory is the author's key assumption and the main source of uncertainty in the model. It is not corroborated externally: not by a pilot, not by contracts, not by an analogue. Everything else in the model is arithmetic derived from that line.

1.3. Tariffs

LINE	RATE	BASE
Issuance fee	0.50%	annual issuance volume
Servicing fee	0.30%	circulating stack
Platform fee	0.15%	issuance volume
B2B2G licences	from 0 to 0.15%	issuance volume
Technology integrations	from 50 to 1,150 RUB mn	fixed connection payments
Appraisal and insurance — gross tariff	0.80%	issuance volume
Appraisal and insurance — offsetting costs	85%	of the gross tariff
Appraisal and insurance — own margin	0.12%	issuance volume; only this part enters revenue

1.4. Costs

Payroll is calculated as headcount × average salary × 12 × 1.30 (social contributions 30%).

First-year salary — RUB 350 thousand per month, indexed at 6% per year.

Other operating costs = a base of RUB 502 mn indexed at 4% per year plus a variable share of 22% of revenue. The variable part covers acquiring, infrastructure under load, compliance, cybersecurity, legal support and customer acquisition; its size is calibrated so that the mature-year margin sits at the level of comparable infrastructure operators.

PARAMETER	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
Headcount	40	120	160	200	240	270	300	330	350	370
Average salary, RUB k/month	350.0	371.0	393.3	416.9	441.9	468.4	496.5	526.3	557.8	591.3
Payroll incl. contributions, RUB mn	218	695	982	1,301	1,654	1,973	2,324	2,709	3,046	3,413
Other operating costs, RUB mn	502	810	1,977	4,479	9,172	13,120	17,506	22,297	27,279	32,090
Capital expenditure, RUB mn	300	420	400	550	1,800	2,400	1,600	1,800	2,300	2,000

PARAMETER	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
Depreciation, RUB mn	43	103	160	239	496	839	1,067	1,281	1,550	1,779

Capital expenditure over the horizon — RUB 13,570 mn. Depreciation period 7 years.

1.5. Taxes and working capital

PARAMETER	VALUE	BASIS
Profit tax	25%	Federal Law 176 -FZ of 12.07.2024, in force from 01.01.2025
Cap on carry - forward of prior - year losses	50%	Art. 283 of the Tax Code
Social contributions	30%	Ch. 34 of the Tax Code
Working capital	5%	of revenue

The profit-tax relief available to accredited IT organisations is not built into the base case — it is separate upside, not an assumption.

VAT. Transactions in digital financial assets are not subject to value added tax: such assets are classified as securities, and the sale of securities is VAT-exempt (sub-clause 12, clause 2, Art. 149 of the Tax Code). The position was confirmed by the owner of the project on 07.09.2026 and is built into the model.

Sheet 2. Revenue

All amounts in RUB mn. The total equals the sum of the lines.

LINE	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
Issuance fee	0	562	2,632	6,692	13,919	17,765	21,555	25,620	29,975	34,638
Servicing fee	0	337	1,917	5,932	14,283	24,942	37,537	51,330	65,300	77,731
Platform fee	0	169	790	2,007	4,176	5,330	6,466	7,686	8,992	10,391
B2B2G licences	0	56	369	1,204	2,784	3,908	5,173	6,661	8,393	10,391
Technology integrations	0	50	180	350	520	650	780	900	1,020	1,150
Appraisal and insurance — own margin	0	135	632	1,606	3,340	4,264	5,173	6,149	7,194	8,313
TOTAL revenue	0	1,310	6,519	17,791	39,021	56,858	76,685	98,345	120,874	142,615

MEMORANDUM	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
Memorandum: gross billings	0	2,075	10,099	26,892	57,950	81,019	106,000	133,188	161,640	189,722

Gross billings are the entire amount passing through the platform, including offsetting payments to appraisers and insurers. The difference between gross billings and revenue is third-party money; presenting it as platform revenue is incorrect.

Sheet 3. Profit and loss

PARAMETER	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
Revenue	0	1,310	6,519	17,791	39,021	56,858	76,685	98,345	120,874	142,615
Payroll incl. contributions	-218	-695	-982	-1,301	-1,654	-1,973	-2,324	-2,709	-3,046	-3,413
Other operating costs	-502	-810	-1,977	-4,479	-9,172	-13,120	-17,506	-22,297	-27,279	-32,090
Total operating expenses	-720	-1,505	-2,959	-5,779	-10,826	-15,092	-19,829	-25,006	-30,325	-35,503
EBITDA	-720	-195	3,560	12,012	28,195	41,766	56,856	73,339	90,549	107,112
EBITDA margin, %	—	-14.9	54.6	67.5	72.3	73.5	74.1	74.6	74.9	75.1
Depreciation	-43	-103	-160	-239	-496	-839	-1,067	-1,281	-1,550	-1,779
EBIT	-763	-298	3,400	11,773	27,699	40,927	55,789	72,058	88,999	105,333
Profit tax	-0	-0	-585	-2,943	-6,925	-10,232	-13,947	-18,014	-22,250	-26,333
Net profit	-763	-298	2,815	8,830	20,774	30,696	41,841	54,043	66,749	79,000

Mature-year margin — 75.1%. Benchmarks of comparable companies: infrastructure exchange and depository operators 65–75%, international payment systems 60–70%.

Sheet 4. Cash flow

PARAMETER	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
EBITDA	-720	-195	3,560	12,012	28,195	41,766	56,856	73,339	90,549	107,112
Profit tax	-0	-0	-585	-2,943	-6,925	-10,232	-13,947	-18,014	-22,250	-26,333
Increase in working capital	-0	-65	-260	-564	-1,061	-892	-991	-1,083	-1,126	-1,087
Capital expenditure	-300	-420	-400	-550	-1,800	-2,400	-1,600	-1,800	-2,300	-2,000
Free cash flow	-1,020	-680	2,315	7,955	18,409	28,242	40,317	52,442	64,873	77,692
Cumulative cash flow	-1,020	-1,701	614	8,569	26,978	55,220	95,537	147,979	212,852	290,543
Discount factor	0.7717	0.5956	0.4596	0.3547	0.2737	0.2112	0.1630	0.1258	0.0971	0.0749
Discounted cash flow	-787	-405	1,064	2,822	5,039	5,966	6,573	6,598	6,298	5,821

Peak funding requirement — RUB 1,701 mn (the largest negative cumulative cash flow). The starting round of RUB 1,800 mn covers 106% of it.

Sheet 5. Enterprise value

PARAMETER	VALUE
Sum of discounted cash flows over 10 years	38,988
Normalised cash flow for the terminal period	78,715

PARAMETER	VALUE
Terminal value at the end of the horizon	320,035
Discounted terminal value	23,979
Share of terminal value in enterprise value	38%
Enterprise value	62,967
The same in US dollars at a rate of 71.55	≈ 880
Project internal rate of return	182.1%
Simple payback	2.73 years
Discounted payback	3.05 years

Caveat on the internal rate of return. The value of 182% is obtained on project cash flows where the inputs are small (a peak of RUB 1,701 mn) while the mature flows run to tens of billions. Such a return is not an advantage of the project: it shows that the model does not reflect the full cost of entering this market — the capital of an information-system operator, reserves, the cost of acquiring pledgors. The figure is given for completeness; negotiations should rest on enterprise value and on the investor calculation (Sheet 8).

Sheet 6. Scenarios

SCENARIO	MARKET SHARE YEAR 10	WEIGHT	REVENUE YEAR 10, RUB MN	ENTERPRISE VALUE, RUB BN	PAYBACK, YEARS
Conservative	7%	15%	56,164	20.1	3.94
Base	18%	55%	142,615	63.0	2.73
Optimistic	25%	30%	197,629	90.2	2.38
Expected value	—	100%	—	64.7	—

Scenarios differ only in the target market share in year ten; the trajectory is scaled proportionally. The weights are set by the author of the project.

Sheet 7. Sensitivity

7.1. Discount rate and market share

Enterprise value, RUB mn.

WACC \ MARKET SHARE YEAR 10	9.0%	13.5%	18.0%	22.5%	27.0%
26.50%	36,389	58,836	81,267	103,692	126,114
28.00%	31,874	51,735	71,580	91,418	111,254
29.58%	27,869	45,426	62,967	80,501	98,033
31.00%	24,800	40,585	56,352	72,114	87,872

WACC \ MARKET SHARE YEAR 10	9.0%	13.5%	18.0%	22.5%	27.0%
33.00%	21,167	34,843	48,501	62,154	75,803

7.2. Operating costs

DEVIATION OF COSTS	- 10%	0%	10%	20%	30%
Enterprise value, RUB mn	65,513	62,967	60,420	57,871	55,315

Sensitivity to costs is low: even a 30% increase changes the valuation by 12%. This means that the entire value is determined by revenue assumptions — that is, by the market-share trajectory.

7.3. Launch delay — the principal risk

DELAY OF THE FIRST ISSUE	FIRST YEAR WITH ISSUANCE	REVENUE YEAR 10, RUB MN	ENTERPRISE VALUE, RUB BN	PEAK REQUIREMENT, RUB MN
none	2028	142,615	63.0	1,701
+1 year(s)	2029	126,422	46.4	3,438
+2 year(s)	2030	107,655	32.5	5,532
+3 year(s)	2031	87,988	21.1	9,126

Every year of delay removes roughly a quarter of the value and increases the cash requirement. The stated round assumes a launch without delay; a one-year slip raises the requirement to RUB 3,438 mn, a two-year slip to RUB 5,532 mn.

7.4. Simulation

2000 iterations, generator with a fixed seed 20260907 — the calculation is reproducible. The following are varied: market share in year 10 (triangular distribution 7–25%, mode 18%), discount rate (uniform 27–33%), deviation of costs (uniform from minus 10% to plus 30%), launch delay (0/1/2/3 years with probabilities 40/30/20/10%).

PERCENTILE	P5	P10	P25	MEDIAN	P75	P90	P95
Enterprise value, RUB bn	14.7	18.5	26.8	39.2	52.9	65.8	73.5

Probability of a value above RUB 50 bn — 29.6%. Probability of a negative value — 0.0%.

The median of the simulation (RUB 39.2 bn) is markedly below the base case (RUB 63.0 bn). This is not an error: the base case assumes a launch without delay, while the simulation allows for delay being likely. The gap between the base case and the median of the simulation is the price of schedule risk.

Sheet 8. Investor calculation

PARAMETER	VALUE
Investment	1,800
Equity stake	9.21%
Holding horizon	7 years, exit in 2033

PARAMETER	VALUE
Enterprise value at exit	261,907
Accumulated cash	97,337
Equity value at exit	359,244
Investor proceeds	33,094
Return multiple	18.4×
Investor internal rate of return	51.6%

The calculation assumes that the plan is delivered in full, that no dividends were paid and that accumulated funds remain in the company. This is an upper bound, not an expectation: the price of the risk of non-delivery is embedded in the stage discount applied when determining the entry value (Sheet 9).

Sheet 9. Entry value (pre-money)

A reconciliation of four approaches. The stage discount of 60% is applied **once**, and only to approaches that produce the value of a mature business. The Berkus and replacement-cost approaches value the project as it stands and are not discounted again.

APPROACH	BEFORE DISCOUNT, USD MN	STAGE DISCOUNT	AFTER DISCOUNT, USD MN	WEIGHT	CONTRIBUTION, USD MN
Income (DCF)	880	applied	352	35%	123.2
Market (multiples)	380	not applied	380	30%	114.0
Risk-adjusted Berkus	35	not applied	35	25%	8.8
Cost (replacement value)	20	not applied	20	10%	2.0
Entry value (pre-money)					248

Pre-money ≈ USD 248 mn ≈ RUB 17.74 bn at a rate of 71.55 RUB/USD.

The spread between approaches is twelvefold — from USD 20 mn on the cost approach to USD 352 mn on the income approach. Such a spread means the weighted figure is itself of limited use: 65% of the weight rests on approaches that value an already operating business, whereas the approaches designed for an early stage give an order of magnitude less. The practical conclusion: the negotiating range should be built from the early-stage approaches, and the income approach used as an argument about potential rather than as a price. The decision on the entry price rests with the owner of the project.

Round structure at this valuation

PARAMETER	VALUE
Pre-money	\$248 · 17.74
Round	\$25 · 1,800
Post-money	\$273 · 19.54
Investor stake	9.21%

The round covers the calculated requirement. The peak requirement is RUB 1,701 mn (end of 2028), the round is RUB 1,800 mn, a cushion of RUB 99 mn. The cushion is thin: a one-year delay in launch raises the requirement to RUB 3,438 mn and the round would not suffice. The launch date is the first thing to keep under control.

In the previous edition the stage discount was applied twice — first inside the income approach, then again on top of the reconciliation. Because of this the entry value was understated roughly twofold. The correction strengthens the project's negotiating position rather than weakening it.

Limitations of the model

1. **The market-share trajectory is not corroborated by anything.** No pilot, no contracts, no comparable project. It is the author's assumption, and the whole valuation rests on it.
2. **The regulatory framework has not been adopted.** The model assumes regulation will permit operation at the stated scale. If that does not happen, only the conservative scenario applies.
3. **Capital requirements for an information-system operator are not modelled** — own funds, reserves, security deposits.
4. **Customer acquisition cost is not shown as a separate line** — it sits inside the variable part of costs as a single amount.
5. **The model carries no debt.** Equity only; no interest tax shield is taken into account.
6. **All flows are in roubles**, there is no currency position.
7. **Macroeconomic parameters are fixed as at May 2026** (except the key rate) and require updating at the date of negotiations.
8. **The model is not an offer** and does not guarantee a result.

Edition v5 · 07.09.2026 · computed programmatically; convergence self-check passed.
